CERTIFICATE OF INDEPENDENT BID DETERMINATION

1 This Standard Bidding Document (SBD) must form part of all bids\(^1\) invited.

2 Section 4 (1) (b) (iii) of the Competition Act No. 89 of 1998, as amended, prohibits an agreement between, or concerted practice by, firms, or a decision by an association of firms, if it is between parties in a horizontal relationship and if it involves collusive bidding (or bid rigging).\(^2\) Collusive bidding is a *pe se* prohibition meaning that it cannot be justified under any grounds.

3 Treasury Regulation 16A9 prescribes that accounting officers and accounting authorities must take all reasonable steps to prevent abuse of the supply chain management system and authorizes accounting officers and accounting authorities to:

a. disregard the bid of any bidder if that bidder, or any of its directors have abused the institution’s supply chain management system and or committed fraud or any other improper conduct in relation to such system.

b. cancel a contract awarded to a supplier of goods and services if the supplier committed any corrupt or fraudulent act during the bidding process or the execution of that contract.

4 This SBD serves as a certificate of declaration that would be used by institutions to ensure that, when bids are considered, reasonable steps are taken to prevent any form of bid-rigging.

5 In order to give effect to the above, the attached Certificate of Bid Determination (SBD 9) must be completed and submitted with the bid:

\(^1\) Includes price quotations, advertised competitive bids, limited bids and proposals.

\(^2\) Bid rigging (or collusive bidding) occurs when businesses, that would otherwise be expected to compete, secretly conspire to raise prices or lower the quality of goods and / or services for purchasers who wish to acquire goods and / or services through a bidding process. Bid rigging is, therefore, an agreement between competitors not to compete.

1. **PURPOSE**
To appoint a qualified service provider to develop a country-specific CO$_2$ emissions factor for the estimation of Greenhouse Gas (GHG) emissions for ferroalloy production in the metal industry.

2. **INTRODUCTION AND BACKGROUND**
The Republic of South Africa ratified the United Nations Framework on Convention on Climate Change (UNFCCC) and is therefore required to undertake several projects related to climate change. The main objective of the UNFCCC is to stabilize Greenhouse gas (GHG) concentrations in the atmosphere at a level that would prevent dangerous human-induced interference with the climate system. The ability of South Africa to achieve this objective is highly dependent on the accurate knowledge of emissions trends and on our collective ability to alter these trends. Article 4, paragraph 1(a) and Article 12, paragraph 1(a), of the convention provide for each Party to prepare and report national GHG emissions and removals to the Conference of the Parties (COP). The key mechanism for reporting these GHG emissions is through the national communication and the Biennial Update Reports.

According to Decision 17/CP.8,3 each non-Annex I Party shall, as appropriate and to the extent possible, provide in its national inventory, on gas-by-gas basis and its units mass, estimates of anthropogenic emissions of carbon dioxide (CO$_2$), methane (CH$_4$) and nitrous oxide (N$_2$O) by sources and removals by sinks. Non-Annex I Parties are encouraged, as appropriate to provide information on anthropogenic emissions by sources of hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF6).

The National Climate Change Response: White Paper, Chapter 6.7 requires the compilation of accurate, complete and updated GHG emissions inventory to ensure a good foundation for effective mitigation responses. The first national GHG inventory in South Africa was prepared in 1998, using 1990 data; it was updated to include 1994 data and published in 2004. In 2009 the country published the third GHG inventory which was based on the base year 2000. Recently (2014) South Africa published its fourth GHG inventory covering the period 2000 – 2010. Several challenges were identified in the compilation of the GHG inventory namely; lack of activity data resulting to incompleteness, use of lower tier methods leading to inaccuracy and lack of transparency on the process of collection of data by data providers.

Based on the latest published (in 2014) GHG inventory, emissions from the metal industry totalled 438 005 Gg CO$_2$eq for the period 2000 to 2010. The major contributor over this period was iron and steel production (69.6 per cent), followed by ferroalloy production (24.8 per cent) aluminium production (5.1 per cent). Ferroalloy production is categorised in the IPCC guidelines under metal production as Ferroalloy production category (2C2). Ferroalloy plants manufacture concentrated compounds that are delivered to steel production plants to be incorporated in alloy steels. South Africa is the world’s largest producer of chromium and vanadium ores and the leading supplier of
their alloys. South Africa is also the largest producer of iron and manganese ores and an important supplier of ferromanganese, ferrosilicon and silicon metal.

Ferroalloy production has been identified as a key category sources of GHG emissions; therefore it is important that activity data and country specific emission factors for this source be readily available to the ensure accuracy of GHG results.

The IPCC guidelines recommends that GHG emissions from key categories should not underestimated or over estimated. The 2006 IPCC does offer default emission factors for the estimation of GHG emissions, however these IPCC default emission factors are generally conservative and not representative of the national circumstances. The accuracy of emission factors for the estimation of GHG emissions from ferrochrome production is dependent on the production conditions such as the characteristics of the reducing agent, slag and other non-products. According to the IPCC good practice guidelines it is good practice for countries to apply higher tier methods such as country specific emission factors and direct measurements to represent national circumstances especially for key categories.

Accurate GHG emissions inventories are essential for the following reasons:

- To fulfil the UNFCCC reporting requirements such as the national communications, Biennial Update Reports
- To evaluate mitigation options and provide a baseline the implementation of GHG reduction programmes
- To assess the effectiveness of policies and mitigation measures
- To develop long term emissions projections
- To monitor and evaluate the performance of South Africa in terms of GHG emissions profile

Furthermore; South Africa is currently in the process of incorporating the GHG component in the National Atmospheric Emissions Inventory System (NAEIS) in order to manage the mandatory reporting of GHG emissions. The developed country specific emission factors will be used for the estimation of GHG emissions from ferroalloy production in the NAEIS system. The development of country specific emission factors will ensure that more accurate emission factors are available to all stakeholders and that consistency and accuracy in the reporting of emissions for both voluntary and mandatory purposes are met.

3. **OBJECTIVES**

In 2010 South Africa produced a total of more than three million tonnes of Ferrochromium (Chromium alloys), as a result ferroalloy production is considered a key category according to the published 2000-2010 national GHG inventory. This study will focus on the development of a CO₂ emission factor for the ferrochrome
production industry; mainly because it is the most emitting type of ferroalloy in South Africa’s GHG emission profile. The main objective of this study is to improve the accuracy of GHG emissions calculations from ferroalloy production (a key category) by advancing to a Tier 2 methodology (use of country specific emission factors).

The main activities of this project are as follows:

- Inception report;
- Develop a country specific CO$_2$ emission factor for ferrochrome production in the metal industry;
- Validation and Verification by an Accredited validating and verification body (VVBs); and
- Facilitate a work group (WG) comprised of experts from ferroalloy production, producers of ferrochrome in South Africa, Department of Environmental Affairs, Department of Mineral Resources and other relevant stakeholders.

4. **SCOPE OF WORK**

This project has four output components in order meet the objectives of developing a country specific CO$_2$ emission factor for ferrochrome production. The outputs are explained below:

4.1 **OUTPUT A: DRAFT INCEPTION REPORT**

4.1.1 The service provider to draft an inception report with the following aspects:

- an overview of the ferrochrome production industry in South Africa;
- methodological approach and measurement parameters
- process unit types in the ferrochrome production industry
- measurement programme
- project management

4.1.2 The measurement programme must be defined with clear objectives, suitable methods; clear instructions to the measurement personnel, well defined data processing and reporting procedures and adequate documentation. (The table below sets out the elements of such an approach)
